About Data wrangling:

Data wrangling, also known as data cleaning or data pre-processing, is the process of transforming raw data into a format that is more suitable for analysis. The goal of data wrangling is to prepare data for downstream analysis, which can include statistical analysis, machine learning, and data visualization.

Data wrangling typically involves a series of steps, including
1. DATA CLEANING (removing duplicates, correcting errors, dealing with missing values, etc.),
2. DATA INTEGRATION (merging data from different sources),

3. DATA TRANSFORMATION (reformatting data, creating new variables, etc.),
4. DATA REDUCTION (selecting a subset of variables or observations for analysis).

Effective data wrangling is critical for accurate and reliable analysis. If data is not properly cleaned and transformed, the results of the downstream analysis can be misleading or incorrect. In addition, data wrangling can be a time-consuming and challenging task, requiring specialized skills and tools. Moreover, data wrangling is a crucial step in the data analysis process, and it requires careful attention to detail and a deep understanding of the data being analyzed.
