Composable Infrastructure Market - PMI

Composable infrastructure enables an organization's data centre to use its own hardware devices and software solutions-based architecture, reducing the time it takes to deploy any other application with equivalent functionality. Composable infrastructure adds value to enterprises by increasing infrastructure operational competencies. It lowers Capex by minimising the expense of overprovisioning stranded resources by supporting the fluid pools of lively assets. It also saves OPEX by lowering the number of different administration tools, which demand a high level of expertise and experience.

Key Highlights:

- In September 2019, TidalScale, a significant player, announced the third iteration of its software-defined server technology. When compared to a standard server, our software-defined server technology improved real-time machine learning, boosted performance and scalability, and delivered up to 10X faster performance.
- DriveScale released its DriveScale Composable Platform in April 2019, which now offers NVMe over TCP functionality.

Analyst View:

Composable infrastructure allows sensitive data to be stored on-premises, minimising security concerns. It also reduces the high costs associated with the public cloud, as well as the concerns and issues surrounding cybersecurity. The introduction of hybrid cloud, on the other hand, is assisting the integration of on-premise and cloud deployment and providing an opportunity for global market growth. Lenovo, for example, has teamed up with Cloudistics to create a hybrid cloud solution for businesses in the ThinkAgile CP series. The expansion of the composable infrastructure industry is projected to be aided by other factors such as data centre consolidation and DevOps agility.
