prevalence of cancer, increase in number of clinical trials and investment in research & development for cancer therapies are driving the growth of oncolytic virus therapies market.

A virus known as an oncolytic virus infects and kills cancer cells. As these cancer cells are eliminated by oncolysis, they produce fresh infectious particles that eliminate any tumour that is still present. The annual mortality rate from cancer is 158.3 per 100,000 persons. In 2018, the estimated cost of cancer in the United States was USD 150.8 billion. As the population ages, this cost is projected to rise, and the demand for innovative, efficient treatments

will drive the market expansion for oncolytic virus therapies.

Governments in developing countries are taking initiatives to create awareness regarding different causes of cancer. Advancement in technology facilitates development of cost-effective therapies and pipeline projects, which is driving the growth of oncolytic virus therapies market. Various awareness campaigns are being conducted to encourage people to opt for early diagnosis which will increase the patient pool of oncolytic virus therapy. However, there are some common side-effects of the therapy, which include chills, nausea, fatigue, fever, flu-like symptoms, and injection site pain. This hinders oncolytic virus therapies market revenue growth.
