Bone replacement refers to the process of replacing a damaged or missing bone with a synthetic or biological substitute. This procedure is commonly performed in cases where the bone is too severely damaged to heal naturally or when a bone is missing due to injury, disease, or a congenital condition.

The most common materials used in bone replacement include metal implants, ceramic materials, and synthetic bone substitutes made from hydroxyapatite, calcium phosphate, or other biocompatible materials. In some cases, natural bone grafts may also be used, which are harvested from the patient's own body or from a donor.
