Typically, asbestos exposure will have occurred sometime between the 1950s and the 1980s. Some of the most prevalent professions that encountered large quantities of asbestos include power plant workers, maritime workers, industrial workers, plumbers, pipefitters, electricians, mechanics, machinists, miners, railroad workers and construction workers, to name a few. Since the latency period for mesothelioma patients is approximately 40 years, most people diagnosed with mesothelioma or asbestos-related lung cancer in 2023 were exposed decades ago.

Agriculture, oil & gas and manufacturing make up the bulk of business in Oklahoma. Oklahomans who worked in the aforementioned industries were likely subject to asbestos exposure for a majority of the twentieth century. In addition, mining company W.R. Grace shipped asbestos-contaminated vermiculite from the notorious mine in Libby, Montana to three cities in Oklahoma (Oklahoma City, Duke and Southard). As a result, residents of Oklahoma undertaking construction and demolition projects should consult with professional abatement specialists to ensure that the projects are performed safely without disturbing any asbestos.
