CAD/CAM materials typically include ceramics, resin composites, and various types of metals. These materials are chosen based on their properties and compatibility with the specific dental restoration being created. For example, ceramics are often used for creating aesthetically pleasing restorations, while metals may be used for their durability and strength.

CAD/CAM systems typically consist of a computer with specialized software for designing the restoration, a milling machine for fabricating the restoration, and other related equipment such as scanners and 3D printers. The process begins with a digital scan of the patient's teeth, which is used to create a virtual model of the restoration. The dentist then designs the restoration

using the CAD software, and the milling machine fabricates the restoration out of the chosen material.
