Dental restoration is the process of repairing or replacing a damaged or missing tooth structure to restore its function, appearance, and overall oral health. Dental restorations can be done using a variety of materials, such as dental fillings, dental crowns, dental bridges, and dental implants. Dental fillings are used to restore a tooth that has been damaged by decay, trauma, or wear. The decayed or damaged portion of the tooth is removed, and the resulting cavity is filled with a dental material, such as composite resin or amalgam.

Dental crowns are used to cover and protect a tooth that has been extensively damaged or weakened. A crown is a custom-made cap that is placed over the entire tooth to restore its shape, size, strength, and appearance. Dental bridges are used to replace one or more missing

teeth. A bridge consists of one or more artificial teeth that are anchored to the adjacent natural teeth or dental implants. Dental implants are used to replace a missing tooth or teeth by surgically placing an artificial tooth root into the jawbone, which provides a stable foundation for a dental crown, bridge, or denture.
