Filgrastim is a medication used to stimulate the production of white blood cells in the body. It is a type of protein known as a granulocyte colony-stimulating factor (G-CSF), which is produced naturally by the body to stimulate the bone marrow to produce white blood cells. Filgrastim is used to treat neutropenia, which is a low level of neutrophils, a type of white blood cell that helps fight infections. Neutropenia can be caused by a variety of factors, including chemotherapy or radiation therapy for cancer, bone marrow transplant, or certain medical conditions.

Filgrastim works by stimulating the bone marrow to produce more white blood cells, which can help reduce the risk of infection and improve overall health. It is typically given as an injection under the skin or into a vein. While filgrastim is generally well-tolerated, some people may experience side effects such as bone pain, headache, fatigue, or fever. Rarely, serious side effects

such as allergic reactions or acute respiratory distress syndrome (ARDS) can occur.
