A patient warmer is a medical device used to maintain a patient's body temperature during surgery or other medical procedures. It is designed to prevent hypothermia, a condition in which the body loses heat faster than it can produce it, and can lead to complications such as shivering, poor wound healing, and prolonged hospital stays.

Patient warmers typically consist of a warming blanket, which is placed on the patient, and a control unit, which regulates the temperature of the blanket. The warming blanket may be made of a variety of materials, such as cotton, polyester, or disposable materials.
