

Sacramento Plastic Surgeon on BroadBand Light Therapy (BBL™)

Plastic surgeon Charles Perry, MD of Chrysalis Cosmetics in Sacramento defines BroadBand Light Therapy (BBL™) and gives information about what it can achieve.

SACRAMENTO, CA, USA, May 9, 2023 /EINPresswire.com/ -- According to Dr. Charles Perry, a [board-certified plastic surgeon](#) who operates Chrysalis Cosmetics in Sacramento, BroadBand Light Therapy (often shortened to “[BBL™](#)”) treatments can significantly improve the quality of a patient’s complexion. Also known as a form of

IPL (intense pulsed light) therapy, this type of treatment applies carefully-measured pulses of light to deeply penetrate the skin. These controlled wavelengths, explains Dr. Perry, can stimulate collagen production and prompt the skin to repair itself, revitalizing texture and creating a more radiant, healthy appearance. “While BBL™ treatments are almost exclusively

non-surgical and minimally-invasive, they can provide noticeable rejuvenating effects that can last for months at a time,” says Dr. Perry.

At Chrysalis Cosmetics, Dr. Perry and his team use three different BBL™ devices to achieve different aesthetic goals. These systems – each developed by the international energy-based aesthetic manufacturer Sciton® – include:

- Forever Young BBL™, designed to combat blemishes and signs of aging (e.g. wrinkles, spots, broken blood vessels,

and minor skin laxity)

- Forever Clear® BBL™, which can both reduce existing acne and eliminate bacteria that can cause future breakouts

- Forever Bare BBL™, used for hair removal on several parts of the body

Dr. Perry states that BBL™ treatments are generally suited for all skin tones and types. That said, he advises patients to consult with an experienced medical professional before deciding to go through with BBL™. “The right surgeon can evaluate a patient’s skin health and aesthetic goals before declaring BBL™ the best choice,” he concludes.
