Combined hormonal contraceptives (CHCs) are a type of birth control method that contains a combination of two hormones: estrogen and progestin. They are available in various forms, including birth control pills, patches, and vaginal rings. CHCs work by suppressing ovulation, thickening cervical mucus to impede sperm movement, and altering the uterine lining to prevent implantation.

Here are the three main forms of combined hormonal contraceptives:

- Birth control pills: These are oral tablets taken daily, typically for 21 or 28 days in a cycle. The

21-day pack contains active hormone pills, while the 28-day pack includes a week of placebo or inactive pills. It's essential to take the pills consistently and at the same time each day for maximum effectiveness.

- **Contraceptive patches:** These are thin, adhesive patches that are applied to the skin, usually on the buttocks, abdomen, upper outer arm, or upper torso. The patch releases estrogen and progestin through the skin into the bloodstream. It needs to be replaced once a week for three weeks, followed by a patch-free week.
- **Vaginal rings:** Vaginal rings are flexible, transparent rings that are inserted into the vagina. They continuously release estrogen and progestin. The ring is left in place for three weeks, and then removed for a one-week hormone-free interval before inserting a new ring.
