Nanocapsules are tiny particles with a core-shell structure, where an active substance or payload is encapsulated within a protective shell or coating. The core-shell structure of nanocapsules provides several advantages, such as protecting the payload from degradation, controlling its release, improving its stability, and enhancing its delivery to target sites.

Nanocapsules are typically on the nanoscale, meaning they have a size range of approximately 1 to 1000 nanometers (1 nanometer is one billionth of a meter). They can be made from various materials, including lipids, polymers, proteins, or inorganic substances, depending on the specific application and desired properties.

The shell or coating of nanocapsules can be designed to be biocompatible, biodegradable, or responsive to specific stimuli, such as changes in temperature, pH, or enzymatic activity. This allows for controlled release of the encapsulated payload at the desired location or under specific conditions.
