Dental biomaterials refer to the substances and materials used in dentistry to restore, repair, or replace damaged or missing teeth and oral structures. These materials are specifically designed to be compatible with the oral environment and perform specific functions, such as providing structural support, mimicking natural tooth appearance, promoting tissue regeneration, or preventing infection.

Dental biomaterials undergo extensive research and development to improve their properties, biocompatibility, durability, and aesthetic qualities. They aim to provide effective and long-lasting

dental restorations that integrate well with the oral tissues and contribute to oral health and function. The selection of appropriate dental biomaterials is based on factors like the specific dental procedure, patient needs, aesthetics, and the clinician's expertise.
