Lumpectomy is a surgical procedure performed to remove a localized abnormality or tumor, known as a lump or mass, from the breast. It is a commonly used treatment option for early-stage breast cancer. During a lumpectomy, the surgeon removes the tumor along with a surrounding margin of healthy tissue. The goal is to completely remove the cancerous tissue while preserving the appearance and function of the breast.

The procedure is typically performed under general anesthesia, and the surgeon makes an incision in the breast to access the tumor. The size and location of the tumor determine the extent of tissue removal. Once the tumor and surrounding tissue are excised, the incision is closed with sutures or surgical staples. In some cases, lymph nodes in the armpit may also be

removed and examined to determine if the cancer has spread.
