Hadron therapy, also known as particle therapy or proton therapy, is an advanced form of radiation therapy used for the treatment of cancer. It involves the use of charged particles, such as protons or other heavy ions like carbon ions, to deliver radiation directly to tumor tissues with high precision. Hadron therapy offers several advantages over conventional radiation therapy techniques, primarily due to the unique physical properties of charged particles.

The main advantage of hadron therapy is its ability to deliver a highly focused dose of radiation to the tumor while sparing surrounding healthy tissues. Charged particles, unlike X-rays or gamma rays used in conventional radiation therapy, have a specific range in tissue, known as the

Bragg peak, where the majority of their energy is deposited. This characteristic allows the radiation oncologist to precisely control the depth at which the radiation is delivered, resulting in reduced damage to healthy tissues and critical structures.
