An API intermediate, in the context of pharmaceutical manufacturing, refers to a chemical compound that is produced during the synthesis or production process of an active pharmaceutical ingredient (API). An API is the specific chemical component in a drug formulation that exerts the desired therapeutic effect. However, the synthesis of APIs often involves several steps, and intermediates are formed at various stages before the final API is obtained. These intermediates are distinct chemical compounds that serve as building blocks or precursors in the synthesis of the API.

API intermediates play a crucial role in pharmaceutical manufacturing as they contribute to the

overall efficiency and quality of the API production process. They serve as key starting materials or intermediates for subsequent chemical reactions and transformations, leading to the formation of the desired API. API intermediates undergo purification, isolation, and characterization to ensure their quality, purity, and safety before being used in the synthesis of the final API.
