

Watercure USA Installs Custom Water Filtration Systems in New York Homes

With an experience of over 30 years, Watercure USA has been offering water treatment services to homeowners and businesses in New York.

LOCKPORT, NEW YORK, UNITED STATES, July 3, 2023 /

EINPresswire.com/ -- Water is essential for survival. It is more important than food since human bodies are made of up to 70 percent water. It is undoubtedly the main reason people are alive and healthy. So having access to clean water is essential. Untreated and unfiltered can cause sickness. Fortunately, nowadays, people have access to advanced water technology, including water filters or [water filtration systems](#), offered by expert services like Watercure USA.

Around the US, many states and cities face the issue of drinking water contaminated by elements such as chlorine, disinfection byproducts, and heavy metals such as mercury, lead, and arsenic. People will also be surprised to know how common it is to encounter bacteria in drinking water. Many types of bacteria and viruses find their way into the water and cause health concerns, including diarrhea, nausea, headache, vomiting, etc. Some microorganisms can even infect people's immune systems. Water filtration systems remove these impurities and make water safe for drinking. Enterprises like Watercure USA offer free water testing to homeowners and businesses to spread awareness about the benefits of filtration systems. They also offer custom treatment solutions depending on piping water quality into the company buildings and homes.

“

We have had our water system for about 15 years. We have the water softener and the reverse osmosis drinking water system. The drinking water tastes great thanks to the reverse osmosis system.”

Donna, Lancaster, NY

Such brands install effective and reliable filters like pre-treatment systems, iron treatment systems, Sulphur treatment systems, well water filters, and reverse osmosis filters.

Filtered water does not just help with people's health, but tastes and smells better too. Tap water tends to taste and smell like chlorine, whereas distilled water has most of the minerals removed so that it will taste very bland. Water filtration systems remove contaminants but leave in the minerals that make water taste good. As a result, a more refreshing and enhanced flavor is derived, resulting in a higher sense of satisfaction after drinking filtered water.

Even after homeowners and business managers invest in high-quality filtration systems, all home and business systems will require preventative maintenance and even eventual replacement. All water treatment systems operate in continuous cycles with little downtime. This can cause sediment trapping, clogged or fouled filter beds, damaged cartridges, etc. To avoid these issues with the water treatment system, people must hire dependable professionals such as Watercure USA to conduct [water filtration repair](#) or upkeep. Running a water system without preventive maintenance for a long duration is pure negligence that may cause system failure, contamination breakthrough, or an expensive repair/replacement.

"We have had our water system for about 15 years. We have the water softener for the entire house and also have the reverse osmosis drinking water system. We love both. The soft water really helps with dry skin and you also use less soap and shampoo, as well as laundry detergent. The drinking water tastes great thanks to the reverse osmosis system. My husband doesn't like to drink bottled water or restaurant water anymore since he can taste the impurities in it. Great

company to work with." – Donna, Lancaster, NY

The continuously working water systems are subjected to problems like wasted power, leakages, inefficient filtration, clogged filters, etc. Therefore, maintenance is essential to prevent such issues. Regular cleaning and replacing cartridge filters, timely backwashing of filters or regeneration of softeners, and backup battery power testing are some common examples of activities undertaken by skilled technicians at firms like Watercure USA. Regular [water filtration maintenance](#) tasks can ensure the system is operating efficiently. Any water treatment system should have a quick visual inspection every quarter to ensure everything is in working order.

Routine maintenance also helps in enhancing the performance efficiency of the water treatment system. For instance, under-the-sink RO water system maintenance suggests the replacement of a pre-filter every 6 to 12 months. Doing this aids in preventing fouling of the reverse osmosis membrane and eventually enhances the membranes'

performance, efficiency, and life. With

water softeners and other ion exchange systems, salt must be replenished to ensure the proper cleaning and recharging of the softener resin. Not doing so would allow hard water to pass through the system and potentially shorten the life of the resin. All of these tasks are as complex as they sound, so it is a sensible option to hire experienced water filtration companies like Watercure USA. The organization is also a longtime member of the Water Quality Association and Water Quality Tested and Certified.

As noted above, water treatment systems are like any complex mechanical device: they can develop malfunctions and require repair. The main issue that most water filter owners face is a

reversion in the water quality to how it was before the system was installed. For example, a malfunctioning water softener may cause flaky white deposits to appear on fixtures and difficulty creating soap lather. Broken water treatment systems can also lead to strange discolorations appearing in the water, either because the system is no longer stopping contamination or because the system is placing excessive additives into the supply. In short, any change in the overall water quality indicates that water filtration repair is required. However, to fix the issue, it is essential to diagnose its cause. Expert engineers at companies like Watercure USA can check if the filtration system is experiencing problems due to a plumbing glitch or a contaminant overload. Then, they can repair any residential or commercial water filtration system.

About Watercure USA

Founded in 1986 by Lance Orton, Watercure USA offers a wide range of water filtration systems to families and companies throughout Buffalo and Western New York. They are also well-known for their custom filtration systems, where they test the water and then design and create a system that will serve its client's demands. Whether people need softer water, deionized water, or simply a glass of the cleanest H₂O, Watercure creates a unique solution for the test results and the customers.
