## Definition:

A mining crusher, also known as a rock crusher or stone crusher, is a machine used to break down large rocks or stones into smaller pieces for various industrial applications. It is commonly used in the mining, construction, and quarrying industries to process materials such as limestone, granite, ore, and other minerals. The primary purpose of a mining crusher is to reduce the size of the raw material so that it can be further processed or used in downstream operations. Crushers accomplish this by applying mechanical force to the material, either by compression or impact, to break it into smaller fragments. Overall, mining crushers play a critical role in the mining industry by facilitating the extraction and processing of valuable minerals and materials from the earth.
