Physiological saline, also known as normal saline or isotonic saline, is a sterile solution commonly used in medical settings for various purposes. It is a solution of sodium chloride (salt) in water that closely matches the concentration of salts found in the human body. The concentration of sodium chloride in physiological saline is typically around 0.9%, making it isotonic with body fluids.

Physiological saline has several uses in medical practice. It is often used for intravenous fluid administration to restore or maintain hydration in patients who are unable to consume fluids

orally or require additional fluid volume. It is considered isotonic, meaning it has the same osmotic pressure as blood and other bodily fluids, ensuring that it does not cause fluid shifts or disrupt the normal balance of electrolytes in the body.
