Definition:

ESR tubes, also known as erythrocyte sedimentation rate tubes, are specialized blood collection tubes used to measure the rate at which red blood cells settle in a vertical tube over a specific period of time. The erythrocyte sedimentation rate (ESR) is a nonspecific marker of inflammation in the body and is often used as an indicator of various underlying conditions.

ESR tubes are typically made of glass or plastic and contain an anticoagulant, such as sodium citrate or EDTA (ethylenediaminetetraacetic acid), to prevent blood clotting. The anticoagulant helps maintain the blood in a liquid state, allowing the red blood cells to settle at a consistent rate.
