Definition:

Transcatheter Heart Valve is a medical device used to replace a diseased or damaged heart valve without the need for open-heart surgery. It is inserted into the heart through a small incision or a catheter, which is guided through blood vessels to the site of the damaged valve. Once in position, the transcatheter heart valve expands and takes over the function of the diseased valve, allowing blood to flow properly. This minimally invasive procedure offers an alternative to traditional valve replacement surgery, particularly for high-risk or elderly patients who may not be suitable candidates for open-heart surgery.
