Fractional Flow Reserve Market

Fractional flow reserve (FFR) is a physiological index used in cardiology to assess the severity of narrowing or blockages in coronary arteries. It is a measurement that quantifies the functional significance of a specific lesion or stenosis in the coronary arteries, helping to determine whether it requires intervention such as angioplasty or stenting.

During a coronary angiography, a thin wire equipped with a pressure sensor is threaded through the coronary arteries to reach the area of interest. By measuring the pressure on either side of the stenosis, FFR calculates the ratio of the maximum blood flow in the narrowed segment to the maximum blood flow in the same artery in the absence of the narrowing. This ratio provides an objective assessment of the degree of blood flow obstruction caused by the stenosis.
