Enteric disease testing diagnoses enteric diseases such as food and water-borne diseases. Microorganisms such as viruses, bacteria, and parasites, cause enteric diseases that affect intestinal health. These pathogens can be contracted by contaminated food and drink and by coming into contact with the excrement of an infected animal or person. Abdominal cramping, vomiting, nausea, and anorexia are common symptoms of enteric disorders, which can cause the body to lose fluids and nutrients. Enteric disease testing involves tests and technologies such as diagnostic assays and rapid tests, testing of stool specimens, complete blood count (CBC) test, blood culture test, urine test, antibody test, and bone marrow test for the diagnosis of the enteric disease-causing agent.
