Radiation therapy involves using high-energy radiation to destroy cancer cells. The radiation can be delivered externally or internally, depending on the type and location of the cancer. External radiation therapy involves using a machine to deliver radiation to the cancer cells from outside the body, while internal radiation therapy involves placing a radioactive source inside the body close to the cancer cells.

Major market players covered in the report, such as -

BD,

Isoray Inc.,

Provision Healthcare,

The potential benefits of radiation therapy are significant. It can be used alone or in combination with other treatments, such as surgery and chemotherapy, to improve outcomes. Radiation

therapy is also a non-invasive treatment, meaning that it does not require surgery, and can be completed on an outpatient basis. Furthermore, radiation therapy can be used to relieve symptoms in patients with advanced cancer, such as pain or breathing difficulties.

In conclusion, radiation oncology is a vital component in the fight against cancer. While it is not without its potential drawbacks, radiation therapy has shown to be an effective treatment for many types of cancer, improving outcomes and quality of life for patients. As research continues, it is likely that radiation therapy will become even more precise and effective in treating cancer.
