Definition:

Annealed glass is a type of float glass that has undergone a specific cooling process called "annealing." Float glass is the most common type of glass used in architectural applications, such as windows, doors, and glass facades. It is produced by melting raw materials at high temperatures and then floating the molten glass on a bed of molten tin to create a smooth and flat surface. Annealing is a heat treatment process that involves slowly cooling the glass to room temperature over a specific period of time. This gradual cooling allows the glass to relax and relieve internal stresses, making it stronger and less prone to spontaneous breakage. Annealed glass is also less likely to break into sharp, dangerous shards when it does break, as it tends to shatter into larger, less harmful pieces.
