Rotogravure printing inks are fluid inks with a very low viscosity that can be drawn into the cylinder's engraved cells and subsequently transferred to the substrate. The paper is run through gas- or electric-fired dryers in order to dry the ink and drive off the solvents or water, which effectively replaces much of the solvent. Before the paper gets to the next printing station on the press, the ink will have dried. Wet inks cannot be overprinted without smearing and smudging; therefore, this is required. High-volume air dryers are consequently installed after each printing station.
