Systemic lupus erythematosus refers to an autoimmune disease that causes the immune system to attack its own tissues, causing widespread inflammation and tissue damage in the affected organs. It affects the joints, skin, brain, lungs, kidneys, and blood vessels. It is the most common type of lupus and cannot be cured, but medical interventions and lifestyle changes can help control it. Treatment for systemic lupus erythematosus consists mostly of immunosuppressive drugs that inhibit the immune system's activity.
