Nuclear medicine is a medical specialty that involves the use of radioactive substances, known as radiopharmaceuticals, to diagnose and treat various diseases. Radiopharmaceuticals are introduced into the patient's body, either orally or intravenously, and then they travel to specific organs or tissues, emitting gamma rays or other types of radiation. These emissions are then detected by specialized imaging devices, such as gamma cameras or PET scanners, which create images of the inside of the patient's body.

Nuclear medicine imaging can be used to diagnose various conditions, such as cancer, heart disease, and neurological disorders. It is also used to evaluate organ function, such as kidney and lung function, and to assess blood flow and metabolism.
