A microphone is a type of transducer that converts acoustic energy into audio signals.

The main product types of microphones are wired microphones and wireless microphones. A wireless microphone does not have a physical cable connecting it to the amplifying equipment it is used with. The user's voice can be transmitted 'wirelessly' to the sound system's receiver using a wireless microphone system. The sound system amplifies the signal from the receiver before sending it to the speakers. The technologies used in microphones are electret, MEMS and others that are used for automotive, commercial security and surveillance, consumer electronics, industrial, medical, noise monitoring and sensing applications. The microphones are used by studio and broadcasting, large venues and events, educational institutions, government and military, corporate and hospitality end-users.
