Lung cancer drugs refer to anti-angiogenic drugs that are used to treat lung cancer. Lung cancer is a type of cancer that decreases the ability of the lungs to supply oxygen to the bloodstream because of the uncontrolled growth of tissues in the lung. Some of the possible treatments for lung cancer include surgery, chemotherapy, radiation therapy, and targeted therapy. Based on the size of the tumor cells, lung cancer is broadly divided into small cell lung cancer (SCLC) and non-small cell lung cancer (NSCLC).

The main types of diseases in lung cancer drugs are small cell lung cancer (SCLC) and non-small cell lung cancer (NSCLC). Small cell lung cancer is a type of lung cancer that grows quickly in the lungs' tissues. Small cell lung cancer has often expanded (metastasized) outside of the lungs by the time a person receives a diagnosis. This malignancy is also more likely to recur after therapy than other types of lung cancer. The different types of drugs include Gemzar, paraplatin, Taxotere, navelbine, avastin, Tarceva, Iressa, and others and are used in various sectors such as hospitals, clinics, and others.
