Psoriasis refers to a skin condition that typically affects the knees, elbows, trunk, and scalp and results with a rash with itchy, scaly spots. The primary contributing factor may be an immune system issue wherein infection-fighting cells unintentionally kill healthy skin cells.

The main classes of drugs in psoriasis are interleukin inhibitors, corticosteroids, anti-inflammatory, and tumor necrosis factor inhibitors. Corticosteroids are a group of steroid hormones generated by vertebrates' adrenal cortex and are also synthetic equivalents of these hormones. The different types of drugs include small molecules and biologics and involve various disease indications such as plaque psoriasis, nail psoriasis, guttate psoriasis, pustular psoriasis, and erythrodermic psoriasis. The several routes of administration include oral, topical, injectable, and distributed through hospitals, retail pharmacies, and e-commerce.
