The thyroid cancer drugs refer to drugs that are used to treat thyroid cancer by blocking several different kinase proteins. These medications function primarily in two ways. First, they aid in preventing Tumors from growing new blood vessels, which they require to do so. They target a few of the proteins that cancer cells often produce to aid in their growth. The thyroid tissue is made up of follicular cells and parafollicular cells in which cancer develops.

The main types of thyroid cancer drugs are radioiodine ablation, thyroid stimulating hormone (THS) suppression, chemotherapy, targeted multikinase therapy, and others. Radioiodine ablation is a type of radiation therapy that uses radioactive iodine to remove or ablate any healthy thyroid tissue that remains following a thyroidectomy. The different types of drugs include ipilimumab, cabozantinib-s-malate, caprelsa (vandetanib), doxorubicin hydrochloride, and lenvatinibmesylate, nivolumab, vandetanib, others and are used in various sectors such as hospitals, oncology clinics, research organizations, others.
