Tumor embolization devices are minimally invasive devices used in the treatment of tumors. These devices are used either to shut down the supply of blood to the tumor or to deliver tumor-killing therapy directly to the tumor.

The main types of tumor embolization devices are radioembolic agents and non-radioactive embolic agents. Non-radioactive embolic agents involve gelatin foam, tris-acryl gelatin microspheres, and polyvinyl alcohol (PVA) used in the treatment of tumors. The applications involved are cancer tumors and noncancerous tumors that are used by various end-users such as hospitals, cancer treatment centers, intensive care units, and surgical centers.
