Aircraft tire refers to a rubber ring that is fitted over a road vehicle's wheel rim to increase traction, lessen road shocks, and support the weight of the aircraft while it is on the ground. It also provides the traction needed for braking and stopping. Aircraft tires are generally made of rubber and are an essential and main body part for every aircraft.

The main aircraft tire products include radial tires and bias tires. A radial tire, also called a radial-ply tire, is a particular design of vehicle tire in which the cord plies are arranged at 90 degrees to the direction of travel, or radially, which is the center of the tire. The different aircraft tire platforms include fixed wing and rotary wing. Aircraft tires are used for applications in wide-body aircraft, very large aircraft, regional transport aircraft, and narrow-body aircraft. The aircraft tires market end-users include OEMs, retread tires, and replacement tires.
