Cardiac valves refer to artificial valves used to keep the flow of blood in one direction from the heart to the rest of the body parts. A cardiac valve is an implantable device used to replace a damaged body valve that has stopped working due to various diseases. The primary function of the cardiac valve is to keep blood flowing in the proper direction through the heart and from the heart into the major blood vessels connected to it.

The main types of cardiac valves are tissue, transcatheter, mechanical, and other heart valves. Tissue heart valves refer to heart valves used in open heart or minimally invasive surgery to prevent blood clots inside the vessels. Animal tissue that is robust and flexible is used to make tissue valves from the valves of animal donors. These valves are used in cardiac valve repair and cardiac valve replacement. The aortic valve, mitral valve, and other positions where the cardiac valve is repaired or replaced in the heart. Hospitals and clinics, specialty centers, cardiac research institutes, and others are the end users of cardiac valves.
