The hydrogen compressor are hydrogen compressor devices that increase the pressure of hydrogen by decreasing gas volume. The compression in a hydrogen compressor is achieved by moving hydrogen through a compressor that decreases gas volume between the inlet and the discharge. The reduced volume results in compressed hydrogen or liquid hydrogen.

The main products in the hydrogen compressor market are oil-free and oil-based. The oil-free market consists of the sale of oil-free hydrogen compressors by entities (organizations, sole proprietors, partnerships) which are intended to compress hydrogen, and the technology process does not require any oil vapors. The power ranges offered in hydrogen compressors include 0–100 HP and 101–200 HP and operate in either single-stage or multiple stages. These devices are used by end-users ranging from oil and gas to chemicals, utilities, refueling stations, and others.
