The industrial gas regulator refers to devices used to regulate the pressure and direction of fluid or gas in the piping in various industries. An industrial gas regulator consists of a separate pressure sensor, a controller, a flow valve, and a diaphragm that regulates the pressure when gas enters the chamber and the fuel can then be delivered from the source to the appliance or device at a certain flow.

The main types of industrial gas regulators are single-stage and dual-stage. The single-stage is used to produce high-purity single-stage gas pressure regulators that are made to regulate the delivery pressures of gases that are either derived from high-pressure bottles or are provided by a facility's line pressure. The various gases include inert, corrosive, and toxic ones. The materials include brass and stainless steel. These are used in oil and gas, chemicals, steel and metal processing, medical care, food and beverages, and other applications.
