Hemodialysis and peritoneal dialysis are used to eliminate waste products and excess fluids such as urea and creatinine from the blood by redirecting blood to a machine for the cleaning

process. Hemodialysis refers to a treatment in which the blood is cleaned using a dialysis machine and a specific filter known as an artificial kidney, or dialyzer. It is a type of dialysis that uses the patient's own bodily tissues inside the abdominal cavity as a filter.

The main types of hemodialysis and peritoneal dialysis are hemodialysis, short-term catheters, chronic catheters, graft, fistula, and peritoneal dialysis. Hemodialysis refers to a procedure where a dialysis machine and a special filter called an artificial kidney, or a dialyzer, are used to clean the blood. The modality is conventional and daily (day time, night time). The end-users involved are hospitals, clinics, dialysis centers, and home dialysis.
