Pompe disease is a genetic condition in which a complex sugar called glycogen accumulates in the body's cells. The situation is caused by a lack of an enzyme known as acid alfa glucosidase (GAA), which breaks down complex carbohydrates in the body.

The main types of pompe disease are the classic infantile form, non-classic infantile form, late-onset form, and others. The classic infantile form of pompe disease is the most well-known, with significant heart dysfunction and obvious hypotonia beginning within a few months after birth. The various diagnosis includes blood test, genetic tests, prenatal tests, and other diagnoses. The treatment for pompe disease includes oral, parenteral, and others. The therapies for pompe disease are enzyme replacement therapy (ERT), substrate reduction therapy (SRT), gene therapy, and others that are used by hospitals or clinics, pharmaceuticals, researchers, and others.
