How To Check and Access Your Trees

*** Look at all pieces of the tree, including the roots, root or trunk flare, fundamental stem, branches, and branch associations. Make certain to inspect all sides of the tree***

Tree Condition: Trees in horrible condition may have many dead twigs, dead branches, or small, off-color leaves.

Tree Species: Certain tree species are prone to specific types of defects. Birch and Aspen often

form weak branch unions.

Tree Age and Size: Older trees, may have accumulated multiple defects and extensive decay.

What to Look For

Hazardous - Tree Removal Services

Defects are visible signs that the tree is failing. We perceive seven primary sorts of tree absconds: dead wood, breaks, feeble branch associations, rot, ulcers, foundational issues, and

horrendous tree engineering. A tree with defects is not hazardous, however, unless some portion of it is with it's striking distance of a target.

Cracks - That can lead to the need for Tree Removal Service

A crack is a deep split through the bark, extending into the wood of the tree. Cracks are extremely dangerous because they indicate that the tree is already failing.

Contact Rice and Company Tree Service if...

- A crack extends deeply into, or completely through the stem.
- Two or more cracks occur in the same general area of the stem.
- A crack is in contact with another defect.
- A branch of sufficient size to cause injury is cracked.

A serious crack like this one indicates that the tree is already failing!

Dead wood- Severity of dead leads/limbs leading to Tree Removal Service

Dead wood is "not negotiable"-- dead trees and large dead branches must be removed immediately! Dead trees and branches are unpredictable and can break and fall at any time . Dead wood is often dry and brittle and cannot bend in the wind like a living tree or branch. Dead branches and tree tops that are already broken off ("hangers" or "widow makers") are especially dangerous!

Take immediate action and call Rice and Company Tree Removal Service Tree Care if...

- A broken branch or top is lodged in a tree.
- A tree is dead.
- A branch is dead and of sufficient size to cause injury (this will vary with height and size of branch).

Weak Branch Unions -Often call for Tree Removal Service

- A weak branch union occurs on the main stem.
- A weak branch union is cracked.
- A weak branch union is associated with a crack, cavity, or other defect.

Cankers

A canker is a localized area on the stem or branch of a tree, where the bark is sunken or missing. Cankers are caused by wounding or disease. The presence of a canker increases the chance of the stem breaking near the canker. A tree with a canker that encompasses more than half of the tree's circumference may be hazardous even if exposed wood appears sound.

Contact Rice and Company Tree Removal Service if...

- A canker or multiple cankers affect more than half of the tree's circumference.
- A canker is physically connected to a crack, weak branch union, a cavity, or other defect.

Root Problems - Causing Uprooting and Need Emergency Tree Removal Service

Trees with root problems may blow over in wind storms needing emergency Tree Removal Service. They may even fall without warning in summer when burdened with the weight of the tree's leaves. There are many kinds of root problems to consider, e.g., severing or paving-over roots; raising or lowering the soil grade near the tree; parking or driving vehicles over the roots; or extensive root decay, when assessing Tree Removal Service.

Soil mounding, twig dieback, dead wood in the crown, and off-color or smaller than normal leaves are symptoms often associated with root problems. Because most defective roots are underground and out of sight, aboveground symptoms may serve as the best warning.

Contact Rice and Company Tree Removal Service if...

- A tree is leaning with root exposure, soil movement, or soil mounding near the base of the tree.
- More than half of the roots under the tree's crown have been cut or crushed. These trees are dangerous because they do not have adequate structural support from the root system.
- Advanced decay is present in the root flares or "buttress" roots.

Severing roots decreases support and increases the chance of failure or death of the tree.

Horrible Tree Architecture

Horrible architecture is a growth pattern that indicates weakness or structural imbalance. Trees with strange shapes are interesting to look at, but may be structurally defective. Poor architecture often arises after many years of damage from storms, unusual growing conditions, improper pruning, topping, and other damage.

A leaning tree may be a hazard. Because not all leaning trees are dangerous, any leaning tree of concern should be examined by a professional arborist.

- A tree leans excessively.
- A large branch is out of proportion with the rest of the crown.

This tree is decayed and badly out of balance because of poor maintenance. It is dangerous, and extremely unattractive!
