Electronic paper display, often known as e-paper display, is a display technology that creates a low-power, paper-like display by mimicking the appearance of regular ink on paper. E-paper displays have image memory, which means they do not require much power to sustain the display but require electricity when the display is changed. E-paper displays are therefore ideal for low-frequency switching displays, such as labels and signage. The e-paper display uses the paper display to enable low power consumption, good readability, flexibility, convenient composition, menu boards, and e-readers.
