The sonar systems refer to systems based on the SONAR (Sound Navigation and Ranging) technology. Sonar is a technique in which sound waves are propagated at a certain frequency for mapping distances and objects, especially in marine navigation, since sound waves can travel a longer distance in the water than radar and light waves. Sound waves emitted or reflected by an object are detected by sonar apparatus and analyzed by software to develop nautical charts, locate underwater hazards, map objects on the seafloor such as shipwrecks, and map the seafloor itself.
