According to the World Health Organization (WHO), the global burden of healthcare-associated infections (HAIs) is a significant public health problem. The following table provides an overview of the global HAI burden:

North America dominates the sterilization services market, followed by Europe, Asia Pacific, Latin America, and the Middle East and Africa. The region's large share can be attributed to rising demand for and adoption of sterilization services as consumers place a greater emphasis on healthy lifestyles and disease prevention. A surge in the geriatric population in the coming years, which will lead to an increase in the prevalence of chronic diseases, the need for sterilization services to reduce the prevalence of HAIs, and the implementation of favorable government initiatives and stringent sterilization regulations are all expected to drive the sterilization services market in the region.

The Asia-Pacific region is expected to provide lucrative opportunities for key players in the sterilization services market. Increased funding from the government and non-government sectors to raise awareness about infection prevention and control, as well as the presence of a large population base, all contribute to the market's growth. Furthermore, the increased focus of leading manufacturers on expanding their presence in emerging Asia-Pacific countries in order to capture a large market share is expected to drive the growth of the region's sterilization services market.

According to the World Health Organization (WHO) report on Infection Prevention and Control in 2022, out of every 100 patients in acute care hospitals, seven patients in high-income countries and about 15 patients in low- and middle-income countries will acquire at least one healthcare-associated infection (HAI) during their hospital stay. They are nosocomial infections that occur during a patient's stay in hospitals and related facilities and are not observed at the time of admission. These infections include central line-associated bloodstream infections, surgical-site infections, catheter-associated urinary tract infections, hospital-acquired pneumonia, ventilator-associated pneumonia, and Clostridium difficile infections. The most common bacteria associated with HAIs include C. difficile, MRSA, Klebsiella, E. coli, Enterococcus, and the Pseudomonas species. Using infected medical devices during diagnostic and therapeutic procedures is a major cause of HAIs.

According to the WHO report, the global burden of HAIs is a significant public health problem. The following table provides an overview of the global HAI burden:

According to the WHO report, the global burden of HAIs is a significant public health problem. The following table provides an overview of the global HAI burden:

Emerging economies such as India, China, Brazil, Russia, and countries in Latin America and

Southeast Asia are expected to provide significant growth opportunities to players operating in this market. Over half the world's population resides in India and China, making these markets home to a large patient population. Public pressure to improve the quality of hospital care, the increased cost of HAls in healthcare systems, the emergence of multi-drug-resistant microorganisms, and the initiatives of government authorities play an important role in the growth of the global market in these countries. In the past few years, medical device manufacturing has witnessed significant growth in the Asia Pacific region. The current development trends among players indicate even greater potential in the coming years. This can be attributed to technological advancements, the growing disease burden, and the increasing number of surgeries performed in this region.

Some reusable medical devices include surgical forceps, endoscopes, and stethoscopes. But, there are concerns about the safety and performance of reprocessed devices. There has been a paradigm shift in the reprocessing of medical devices, with increased emphasis on the quality management systems approach that requires validated sterilization instructions from manufacturers and ongoing monitoring by reprocessing personnel to ensure the adequacy of sterilization. The FDA is taking steps to reduce the risk of infection from reprocessed reusable devices by conducting reviews of premarket and post-market information from all manufacturers and reprocessed device types.
