The fatty amines are used as surfactants in various industries. Fatty amines are characterized as any variation of amine that is associated with at least eight carbon atoms in a hydrocarbon chain. These amines are regularly placed in oleochemicals and are fabricated by the process of hydrogenation in greasy nitriles. These are obtained by hydrogenation of fatty nitriles, which are produced by the reaction between triglycerides, fatty acids, or fatty esters and ammonia with the elimination of two molecules of water at high temperature in the presence of dehydrating catalyst (such as silica gel, alumina, or iron-based catalysts).
