A desiccant is a hygroscopic substance that absorbs moisture from the environment and protects products from moisture damage. The desiccants are generally used to keep items dry and stable.

The main types of desiccants are silica gel, zeolite, activated alumina, activated charcoal, calcium chloride, clay, and other types. Silica gel is defined as a non-crystalline and highly porous form of silica that is used for removing moisture from liquids and gases. It is used as a drying agent that protects certain commercial and food products. The major processes of desiccants include physical adsorption and chemical absorption. The various applications of desiccants include electronics, food, pharmaceuticals, packing, air and gas drying, and other applications.
