Indolent Lymphoma Overview

Indolent lymphomas are a group of slow-growing, low-grade non-Hodgkin lymphomas characterized by the gradual accumulation of abnormal lymphocytes. These lymphomas, including follicular lymphoma and marginal zone lymphoma, often exhibit a less aggressive clinical course compared to their aggressive counterparts. Individuals with indolent lymphoma may present with painless swelling of lymph nodes, fatigue, and other nonspecific symptoms. Diagnosis involves lymph node biopsy, imaging studies, and molecular tests. While indolent lymphomas are considered incurable, they can be effectively managed, and many individuals experience long periods of remission with treatment. Treatment options include watchful waiting, radiation therapy, immunotherapy, and chemotherapy. The choice of therapy depends on factors such as the extent of the disease, overall health, and individual preferences. Regular follow-up and ongoing communication with healthcare providers are essential in managing indolent lymphomas and optimizing the quality of life for affected individuals.
