Cervical Cancer Overview

Cervical cancer develops in the cells lining the cervix, the lower part of the uterus. It's primarily caused by certain strains of the human papillomavirus (HPV), a sexually transmitted infection. Early stages often have no symptoms, making regular screening, like Pap smears or HPV tests, crucial for early detection. Symptoms may include abnormal vaginal bleeding, pelvic pain, or pain during intercourse. Risk factors include smoking, weakened immune system, early sexual activity, multiple sexual partners, and a history of sexually transmitted infections. Prevention includes HPV vaccination, safe sexual practices, and regular screenings. Treatment options depend on the stage and may include surgery, radiation, chemotherapy, or a combination. With early detection and proper treatment, the prognosis for cervical cancer is often favorable, highlighting the importance of education, prevention, and access to healthcare services.
