Herbicides, commonly known as 'weed killers,' are chemical substances used to control unwanted plants. The features of herbicides include selectivity, activity, mobility in soil, volatility, toxicity, and persistence in the environment.

The main types of herbicides are synthetic and bio-based. Synthetic herbicides can affect plant disease through a variety of mechanisms. They can promote illness or protect plants against diseases through direct actions on the microbe, indirect effects on the plant, or combined effects on both species. The mode of action in herbicides is selective and non-selective and is used in grains and cereals, pulses and oilseeds, commercial crops, fruits and vegetables, and turf and ornamentals.
