Hydrogen is produced as a by-product of industrial chlorine production by electrolysis. Although it requires expensive technologies, hydrogen can be cooled, compressed, and purified for use in other processes on-site or sold to a customer via pipeline, cylinders, or trucks.

The mode of distribution of the hydrogen in the pipeline is high-pressure tube trailers or cylinders. A pipeline is a line of pipes with pumps, valves, and control devices for conveying liquids, gases, or finely divided solids. The applications involved are chemicals, refineries, metal processing, and other applications. The various end-users are chemicals, aerospace and automotive, energy, refining, glass, welding, metal fabrication, and other end-users.
