A supercomputer is a computer with the architecture, resources, and components necessary to

perform large computations. Today's supercomputers are made up of tens of thousands of processors that can do billions or trillions of calculations per second. A supercomputer is generally intended for use in businesses and organizations that demand a large amount of computational power. A supercomputer combines architectural and operational elements from parallel and grid processing, in which a process is run on thousands of processors at the same time or spread among them.
